

Software Engineer

Professional Summary

Software Engineer with 4+ years designing and operating high-throughput, fault-tolerant backend services using Java, Spring Boot, Kubernetes, event-driven architectures, and cloud infrastructure. Experienced supporting systems used by thousands of users and processing millions of events daily. Motivated by building reliable platforms that support high-volume, customer-critical workflows at scale.

Professional Experience

Software Engineer II | J.B. Hunt, Inc. | August 2022 – October 2025

Java • Spring Boot • Kubernetes • Redis • ActiveMQ • Azure DevOps

- Designed and operated fault-tolerant, low-latency Java microservices supporting real-time workflows used by thousands of drivers daily.
- Built and maintained React-based UI components consuming Spring Boot APIs for internal tooling.
- Collaborated with product managers, QA, and platform teams to align technical solutions with business needs.
- Led development and refactoring of 25+ REST API endpoints, reducing cascading failures and improving request latency across dependent systems.
- Implemented Redis caching and async messaging (ActiveMQ) to reduce downstream load and support scalable, event-driven processing by 15%.
- Improved engineering velocity by enhancing CI/CD pipelines in Azure DevOps, reducing deployment times, and increasing reliability across core logistics microservices.
- Analyzed millions of event records in Google BigQuery to monitor system behavior, detect anomalies, and support operational insights.
- Managed deployments for 90%+ Java services, strengthening application resilience and environment consistency.
- Diagnosed and resolved 100+ production incidents, performing root-cause analysis, and implementing long-term fixes.
- Mentored 5+ engineers, helping them troubleshoot issues, debug services, and implement best practices.
- Built event-driven integrations using ActiveMQ, enabling scalable asynchronous workflows.
- Built automated integration, contract, and load tests, maintaining 95%+ coverage across multiple services.
- Executed performance and load-testing using JMeter style techniques to benchmark API throughput and latency.
- Utilized Grafana dashboards to monitor microservice health, visualize latency trends, and identify performance regressions across distributed systems.
- Worked in an iterative, test-driven development environment, collaborating with product and design partners to estimate user stories and deliver customer-focused features.

Software Developer | Whitesky Communications, Inc. | October 2021 – August 2022

Java • JavaScript • TypeScript • MongoDB • Angular • Linux (WSL/Bash)

- Implemented Test-Driven Development (TDD) to maintain 90%+ test coverage and improve code quality.
 - Built and optimized Java-based REST APIs supporting operations across 500+ locations, improving performance through query optimization and caching.
 - Diagnosed and resolved 50+ production issues, improving system uptime and stabilizing distributed workflows.
 - Authored technical documentation for API contracts, system architecture, and onboarding guides.
 - Developed backend microservices within a Linux-based development environment using Bash, SSH, and WSL.
 - Maintained Node.js services and utilities to support API integrations and streamline backend workflows.
 - Collaborated with frontend engineers to integrate Angular-based UIs with backend APIs, ensuring consistent API contracts and performant client-server interactions.
-

Selected Project

Job Link App (React, Java, Python, FastAPI, SQLAlchemy, Docker) | GitHub

- Built end-to-end integration tests using Testcontainers and Pytest.
 - Built and developed API endpoints using FastAPI services for scalable data ingestion and processing.
 - Dockerized services to enable reproducible local and CI environments.
 - Integrated Keycloak with OAuth2.0 for secure authentication, reducing security incidents by 30%.
-

Technical Skills

Languages: Java, Python, JavaScript / TypeScript, React

Backend & APIs: Spring Boot, REST APIs, Microservices, Event-Driven Systems

Cloud & Infrastructure: Kubernetes (AKS), Docker, CI/CD (Azure DevOps)

Data & Messaging: PostgreSQL, MongoDB, Redis, ActiveMQ, Google BigQuery
